

The platform for working with partners on **controlled content and data**

CARA Hub is a cloud-based platform that synchronizes internal data and documents to a shared environment to enable secure collaboration on projects with your industry partners. The host company can onboard and offboard partners quickly without requiring IT involvement and setup of internal network IDs for partner users.

CARA Hub is a single platform which slots into your current IT landscape to improve management of partner projects. CARA Hub provides creation, workflows and GxP compliant eSignature for working on content and data. Everything is fully audited, version controlled, and traceable, with seamless integrations to the CARA Platform or other 3rd party systems.

Why Collaborating Securely is Hard Today

- ❌ Setup and decommissioning of partners involves IT, adding cost, time, and manual effort each time.
- ❌ Creation and management of users involves IT, adding users to the internal company network etc.
- ❌ Documents and data are not properly secured and audited.
- ❌ Multiple versions of documents can arise leading to lack of control / additional manual effort to combine.
- ❌ Master data and business processes including eSignature are not available when sharing individual documents.
- ❌ Only "existing" information is shared easily - no easy facility to define all information to be shared even when created later or by the partner.
- ❌ Cost is a major factor - setup, maintenance, security, policies enforcement, compliance and management of multiple copies of data / documents.

Benefits

Automated partner setup – save cost and time

An automated wizard creates individual workspaces, groups, and collaboration areas for partners which can be run by business admins.

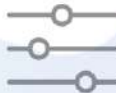

Reduced IT involvement

User management becomes the partner's responsibility – and can be linked to partner Active Directory, with no access required to the host company's internal systems.

Security and Auditing

All documents and data are subject to strict and granular security and audit trails of all activities related to documents or partner users.

Increased Control

The documents never leave CARA – all work is done (including simultaneous editing) on a single copy and version tree controlled in CARA.

No reliance on partners' IT infrastructure

Less mature partners may not have GxP processes in place, with CARA Hub the host company can continue working with them without risking non-compliance.

Data and Process Management

Full MDM (Master Data Management) and BPM (Business Process Management) including workflows and eSignature is available in CARA Hub.

Scalability

More partners can be added or removed at any time, as your business grows CARA Hub can expand to accommodate more data and more partners.

Integrations

Connect to your current systems easily and quickly, centralising information from different sources.

Simplified licensing

CARA Hub has a simple license model, and all setup, maintenance, and security is automated as part of this. Hosts can pass on costs to Partners if required.

Features

Setup

- Host multiple partners in one platform
- Automated wizards for provisioning and 'spinning-down' of Partner workspaces
- Partner user management done by partners including linking to their Active Directories
- Partners only see their workspace while the host company has a full-platform view across all partners

Joint Project Work

- Document management and collaboration including multi-user simultaneous editing
- Streamline processes using workflows and eSignatures
- (Master) Data Management collaboration and context
- Full Business Process Management (BPM) for complex processes between host and partner including working with full submission structures / Virtual documents

Compliance and Security

- Granular and configurable security rules
- Full auditing of all actions to GxP requirements
- 21 CFR Part 11 / EU Annex 11 compliant
