

CARA Management Centre

For the CARA Enterprise Platform

Streamline your configuration management and accelerate data migrations with the CARA Management Centre (CMC) on the CARA Enterprise Platform. CMC is a standalone management application that connects to your CARA instances through the CARA REST API, helping organisations maintain configuration consistency across environments, reduce errors, and ensure governance and compliance throughout enterprise operations.

CMC PROCESS ON THE CARA ENTERPRISE PLATFORM

01 Specification Management

Generate, export, and manage specifications in Excel-readable format. Select specification types and schedule exports to automatically create documentation for review, distribution, and knowledge sharing across the organisation.

02 Configuration Comparison

Compare configurations between two CARA instances to identify differences and ensure systems are in sync. Enter credentials for secondary systems and schedule comparison to receive detailed reports on configuration discrepancies between instances.

03 Historical Change Tracking

Monitor all modifications within a specific timeframe. Review change timelines with predefined date ranges and filter by modifier, critical for governance and audit purposes.

04 Data Migration & Import

Migrate content and metadata, from your PC or AWS S3, directly into CARA using automated mapping. Configure mapping templates to match source columns to CARA attributes, apply dictionary substitution for terminology alignment, and run validations or dry runs before committing data.

Load complete version histories in a single pass and attach PDF renditions if needed. Choose the run mode to suit the load, Regular mode runs CARA's on-create/on-save scripts and validations, while Batch (Bulk) Import mode runs faster by bypassing those rules where needed, ideal for high-volume initial migrations (version-tree import runs in Batch mode only).

05 Configuration Insights

Understand how your configuration is actually used before you change it. Config Insights reports how type attributes are utilised across the system, which attributes are really in use, where, and how much. Use it to run impact analysis before a change, surface unused or redundant attributes, and drive model cleanup and rationalisation, so configuration decisions are based on evidence.

for enterprise
configuration**

BENEFITS

Specification Management & Export

Export specifications in standardised formats on demand, enabling documentation creation and knowledge sharing across teams, departments, and the organisation with accurate, current information.

Configuration Synchronisation & Comparison

Identify and reconcile configuration differences between multiple CARA instances, ensuring consistency and preventing drift across environments.

Comprehensive Change Auditability

Gain complete visibility into who made what changes, when, and where, thereby creating clear audit trails for governance, compliance, and accountability.

Automated Data Migration

Migrate large volumes of data from Excel or other systems directly into CARA using intelligent mapping templates, eliminating manual data entry, reducing errors, and accelerating implementations.

Validation & Quality Assurance

Run validation reports and dry runs before committing data, identifying and resolving mapping issues, missing values, and errors before they impact CARA systems.

Artifact Usage Analytics

Track where attributes and objects are used across different configuration types and throughout the system, supporting data governance and change management.

WHY CARA Migration Centre?

Ensured Consistency

Easily compare and synchronise configurations across multiple CARA instances and departments to maintain uniformity and prevent configuration drift across the enterprise.

Reduced Errors

Streamline migrations with configurable mapping and automatic validation, minimising manual errors that come with spreadsheet-based approaches and duplicate systems.

Auditability & Governance

Gain clear visibility into configuration changes and data lineage. Document all migrations and modifications with comprehensive audit trails for regulatory authorities, internal audits, and compliance reviews.
