

CARA User Interface for Alfresco and EMC Documentum

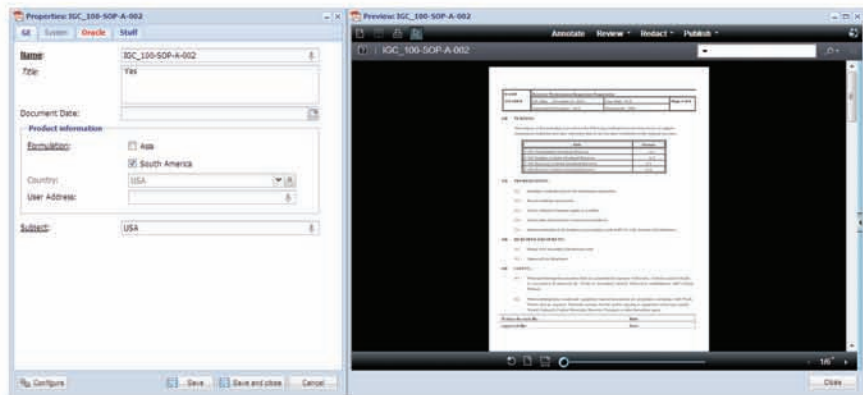

Full integration with **Brava!® Enterprise** for universal viewing, annotation, redaction and file transformation

Full Brava functionality with the CARA user interface for EMC Documentum and Alfresco

IGC's Brava! Enterprise is built into the Generis CARA user interface, allowing embedded preview and markup within the main window or pop-ups. Within the Brava HTML5 client, users can view, annotate and redact Microsoft Office documents, engineering drawings, digital photographs and more. Users can also transform files into TIFF and PDF renditions for distribution and archiving. The combination of CARA and Brava also enables the ability to report on annotations across multiple documents such as a complete project portfolio, without having to open each document individually.

CARA integration with Brava Enterprise

Brava offers these key benefits, and more:

Easy-to-use, intuitive interface. The Brava interface is highly intuitive; the menus are divided into functions and all the tools are clearly labeled. The clean user interface expedites deployments and adoption. Due to its simplicity, productivity increases immediately and the risk of users downloading non-approved software is greatly reduced.

Enables quality decision making. Brava is the only universal viewer to offer both industry-standard libraries to read native files, as well as, a more accurate print-capture method.

Improves workflow process and collaboration. Brava increases efficiency; it reduces the time spent on reviews as it allows multiple users to mark up and comment on the same documents and drawings simultaneously.

Protects sensitive information. Great attention is given to all aspects of keeping content safe. Brava does not download original files to client machines. All annotations and redactions are saved to separate XML files, so the source files are never changed. The redaction tools in Brava remove sensitive content completely, even stripping out hidden text and metadata.

Fast access to content. Brava allows access to pages as they are needed - without waiting for the whole file to download. Searching for words or phrases is simple; more complex searches use regular expressions. All hits are highlighted for quick identification and can be viewed in context.

Enterprise class. Brava is highly scalable, providing top performance for large user counts on a minimal amount of hardware.

Highlights of the CARA integration with Brava:

Preview panel. Click on a document in the CARA list pane to open the document in Brava.

Preview pop-up. Open a document in Brava within a pop-up window inside the CARA browser to take full advantage of the CARA multi-window capabilities.

Properties and preview. Open the document properties and see a preview dialog box at the same time. This enables a user to copy a document title into an ECM Documentum attribute, as well as other useful functions.

Protect original documents in CARA by allowing them to be opened in Brava only.

Annotations Report. Select multiple files and view a report of all the comments extracted from Brava. This can be exported to Microsoft Excel for a full overview of the process.
