# cara

Migration Tools | Configurable system and content migration for CARA

DocMigrator provides functionality to migrate data between repositories on the same platform or across platforms. Functionality includes:

- Rules-based mapping of metadata: replacement, concatenation, substrings, query-based updates, adding and dropping values.

- Handling of versions, renditions and virtual documents.

- Migration of related objects, including remapping of object IDs.

SysMigrator allows migration of all system objects required to support migrating content from one environment to another, including:

- Users, groups, roles

- ACLs

- Types, procedures

- Jobs and methods

- Registered tables

- Any custom system objects
